

LIBAM: The Amoeba core library

This module provides simple standard input and output routines (tty) using only a restricted tty implementation. Can be used within a restricted Amoeba environment. The terminal server (tty) is resolved with environment variables:

TTY

The generic tty server capability.

STDIN

The standard input channel capability (tty).

STDOUT

The standard output channel capability (tty).

STDERR

The standard error channel capability (tty).

The following functions are replacements for the common `printf` function known from the standard C library.

Programming Interface

```
long stdout ( char *fmt ,  
              ... );  
long stderr ( char *fmt ,  
              ... );
```
